DISTO PRESENTS

THE COCO 3 1-MEG UPGRADE KIT

Tired of getting a 207 (out of memory) error under OS9. Well, I have a solution for you!! Install this kit and your memory problems will be over. With this kit, you will have a total memory capacity of 1 mega byte. Yes! A full 1-MEG!

This kit includes two main parts;

- 1: A small PC board that holds the circuits that allows the GIMI chip to access two 512K banks of memory.
- 2: A special 512K memory (with or without chips) board that allows you to plug in a second 512K memory board, giving you a total of 1 meg of memory.

Installation;

Installation is simple but requires soldering skill. Here is an overview of the installation procedures;

- 1: Remove the cover of your COCO 3 and solder the adapter clip on top of the CPU.
- 2: Insert the decoder board into the adapter.
- 3: Remove the existing 512K memory board from its connector and plug it into the special 512K adapter board.
- 4: Insert the double board assembly back into the COCO 3.
- 5: Plug in the interconnecting wire, and external power supply wire.
- 6: Replace the cover and enjoy your 1 MEG COCO 3.

The COCO 3 Upgrade kit comes complete with all parts required to upgrade a 512K COCO 3 to a 1-MEG COCO 3. This kit is designed by Tony DiStefano, manufactured by and distributed by CRC Inc. 11 Boul. Des Laurentides, Laval PQ Canada. H7G 2S3. Tel (514) 967-0195. OS9 software drivers written by Kevin Darling. The COCO 3 1-MEG UPGRADE KIT is copyright by DISTO. The COCO 3 is a registered trade mark of Tandy Corp.

"AVAILABLE IN DEC 89"
